

Start with  
database  
feature vectore

Project database  
onto  
subspaces

Map database on curves  
(computation of  
extended-keys)

Store base in  
sorted lists  
(subindexes)

Start with  
query  
feature vector

Project query  
onto same  
subspaces

Map query on curves  
(computation of  
extended-key)

Retrieve *probe-depth*  
closest cadicates to query's  
key on each subindex

Compute distances  
from query to each  
candidate on the  
*original space*

Return the  $k$   
nearest  
candidates
