

( a )

Quantum circuit diagram (a) showing a CNOT gate. The control line (top) has a green square with a black 'X' on it. The target line (middle) has a CNOT gate symbol (a circle with a cross). The circuit is connected to measurement gates labeled  $M_z$  and  $M_x$ .

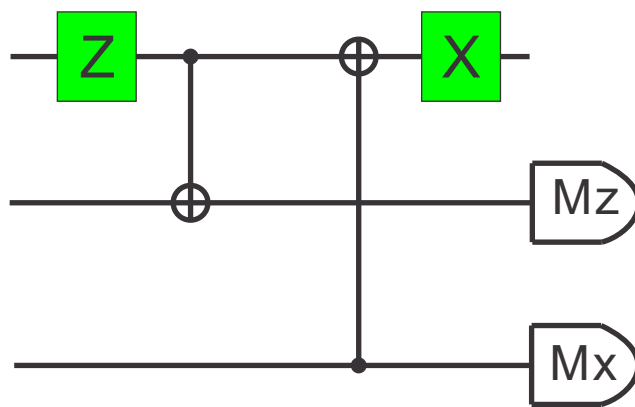

(b)

Quantum circuit diagram (b) showing a CNOT gate followed by a Z gate on the top qubit, and a CNOT gate with the top qubit as control and the bottom qubit as target. The bottom qubit is then measured in the X basis ( $M_x$ ). The top qubit is measured in the Z basis ( $M_z$ ).

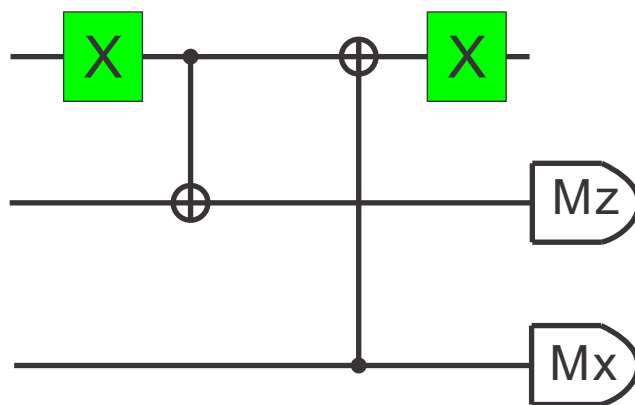

(c)

Quantum circuit diagram (c) showing a CNOT gate with a green box labeled 'Y' on the control line, followed by a CNOT gate with the control line and target line swapped, and measurements  $M_z$  and  $M_x$ .

( d )

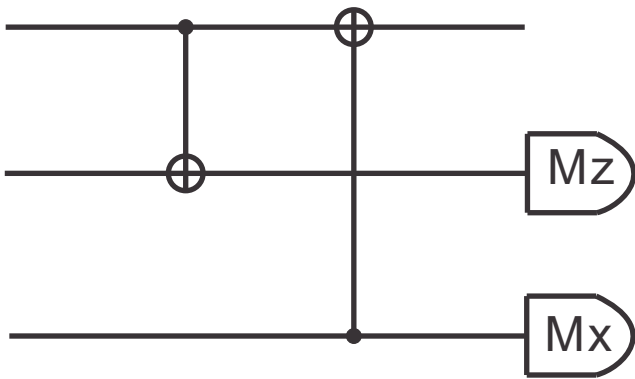

Quantum circuit diagram (d) showing a CNOT gate with a green X on the target line, followed by measurements  $M_z$  and  $M_x$ .

( e )

Quantum circuit diagram (e) showing a CNOT gate followed by a Z gate on the target qubit, and measurements on both qubits.

- Qubit 1 (top line) is the control of a CNOT gate.
- Qubit 2 (middle line) is the target of the CNOT gate.
- After the CNOT gate, a Z gate is applied to Qubit 2.
- Measurements are performed on both Qubit 1 (labeled  $M_z$ ) and Qubit 2 (labeled  $M_x$ ).

(f)

Quantum circuit diagram (f) showing a CNOT gate with a green Y gate on the target line, followed by  $M_z$  and  $M_x$  measurements.
