

(a)

Quantum circuit diagram (a) showing three horizontal qubit lines. The top line has a control dot for a CNOT gate targeting the middle line. The middle line has a green square labeled 'X' and a target circle with a plus sign for the first CNOT. It also has a control circle with a plus sign for a second CNOT targeting the bottom line. The bottom line has a target dot for the second CNOT. The middle line ends with a measurement gate labeled 'Mz', and the bottom line ends with a measurement gate labeled 'Mx'.

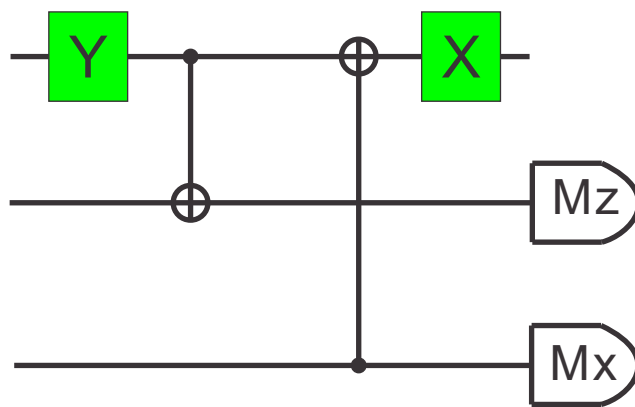

(b)

Quantum circuit diagram (b) showing a CNOT gate with control on the top qubit and target on the middle qubit, followed by a CNOT gate with control on the middle qubit and target on the bottom qubit. The middle qubit is measured by M_z , and the bottom qubit is measured by M_x .

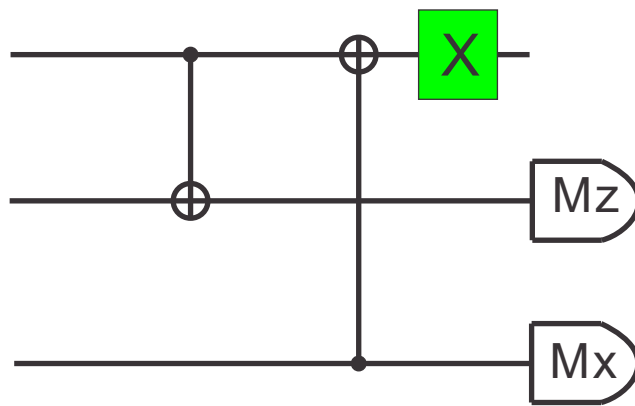

(c)

Quantum circuit diagram (c) showing a CNOT gate and a Hadamard gate. The circuit has three horizontal lines representing qubits. The top line has a control dot connected to a target circle on the middle line, forming a CNOT gate. The middle line has a Hadamard gate (H) represented by a square with an 'H' inside. The bottom line has a control dot connected to a target circle on the middle line, forming another CNOT gate. The middle line ends with a measurement gate labeled 'Mz'. The bottom line ends with a measurement gate labeled 'Mx'.

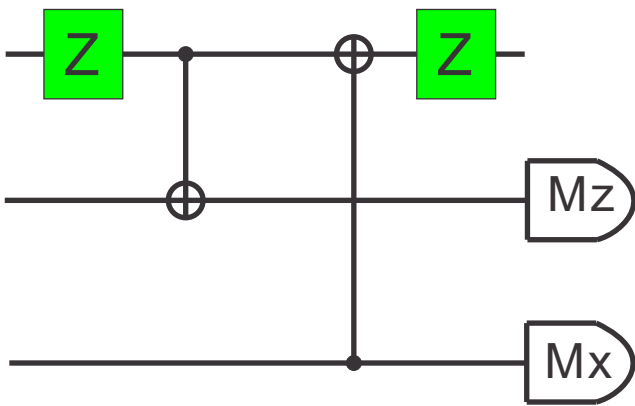

(d)

Quantum circuit diagram (d) showing three horizontal lines representing qubits. The top line has a control dot for a CNOT gate targeting the middle line. The middle line has a control dot for a CNOT gate targeting the bottom line. The bottom line starts with a green box labeled 'X' and ends with a measurement gate labeled 'Mx'. The middle line ends with a measurement gate labeled 'Mz'.

(e)

Quantum circuit diagram (e) showing a sequence of operations on three qubits. The top qubit has a control dot for a CNOT gate on the middle qubit, followed by a target dot for a CNOT gate on the bottom qubit. The middle qubit has a control dot for a CNOT gate on the bottom qubit. The bottom qubit has a green box labeled 'Z' and a target dot for a CNOT gate from the top qubit. The circuit ends with measurement gates labeled 'Mz' and 'Mx' on the middle and bottom qubits respectively.

(f)

Quantum circuit diagram (f) showing a sequence of operations on three qubits. The top qubit has a control dot for a CNOT gate on the middle qubit, followed by a target circle for a CNOT gate from the middle qubit. The middle qubit has a target circle for a CNOT gate from the top qubit and a control dot for a CNOT gate on the bottom qubit. The bottom qubit has a red box labeled 'Y' and a control dot for a CNOT gate from the middle qubit. The circuit ends with measurement gates labeled 'Mz' on the middle qubit and 'Mx' on the bottom qubit.
