

-  Forward & Backward for EAN
-  Forward & Backward for ME
-  Forward & Backward for Conv-L
-  Forward Only

B : Original Batch

B_{EAN} : Batch used for training EAN

B_1, B_2, B_3 : Batches used for training ME

 : weight sharing

The diagram illustrates the architecture of the proposed ME-EAN model. It shows a multi-scale feature extraction process. Input batches B are processed by an EAN Batch Sampler to produce EAN_t . This is then processed by an ME Batch Sampler to produce ME_t . The ME_t is then processed by a series of EAN_{t-1} blocks, each containing a $512 \times 7 \times 7$ convolution, a $512 \times 7 \times 7$ convolution, and a 3×3 convolution, followed by a cross entropy loss. The final output is ME_{t-1} , which is then processed by a series of ME_{t-1} blocks, each containing a $512 \times 7 \times 7$ convolution, a $512 \times 7 \times 7$ convolution, and a 3×3 convolution, followed by a softmax classification loss and an L1 bounding box regression loss. The final output is ME_t .
