

Ad-hoc mass clustering to study temporal evolution of MAb

TOF-MS peptide mass fingerprinting of monoclonal antibody

CSIC

OBJECTIVE

Provide a suitable algorithm to study temporal evolution of peptide mass fingerprinting obtained after enzymatic digestion of mAb by trypsin, using Matrix Assisted Laser Desorption Ionization Time Of Flight Mass Spectrometry (MALDI-TOF).

ANALYTICAL METHOD

Trypsin digestion of Rituximab solution. Rituximab solutions were diluted with ammonium acetate (10 mM) to end up with 1 µg of protein.

Approximate quantification of the digested sample prior to MALDI-TOF spectrometry. 10 mM solution. Incubation at 37 °C for 4 hours.

Trypsin digestion. 0.2 mM. Incubation at 37 °C for 4 hours.

Matrix Assisted Laser Desorption Ionization (MALDI) spectrometry. 0.1% in 0.1% solution. 0.1% in 0.1% solution.

TOF-MS analysis. Rituximab digested was mixed with 10 µL of 10 mM HCl. 1 µg of protein. 10 µL of 10 mM HCl. 1 µg of protein.
