

## **MODEL**

The rules below were trained to predict bike demand. The rules are not disjoint, but all the rules together make up one machine learning model. If an observation does not fall in any one rule, it gets the last prediction “Otherwise bike demand is ...”. Hour denotes hour-of-day, i.e. 0, 1, 2, ... 23. Temperature is in Celsius.

If year=2012 and workingday=yes then bike demand is 2.42

If season=fall and year=2012 then bike demand is 2.82

If season=summer and year=2012 then bike demand is 2.61

If season=fall and workingday=yes then bike demand is 2.36

If season=fall and year=2012 and workingday=yes then bike demand is 2.93

If hour=17 and workingday=yes then bike demand is 5

If hour=18 and workingday=yes then bike demand is 4.78

If season=summer and yr=2012 and workingday=yes then bike demand is 2.57

If hour=08 and workingday=yes then bike demand is 4.48

If hour=17 and year=2012 then bike demand is 5.75

If hour=18 and year=2012 then bike demand is 5.44

If month=08 and season=fall then bike demand is 2.42

Otherwise bike demand is 1.34
