I. CRYSTAL STRUCTURES

Table I present a list of all crystalline films indicated in the experimental section (Sec. III of the main text). The last entries are values taken from literature. Error estimates of q_b values are smaller than the last digit. All substrates were YAlO₃ unless otherwise indicated. The incommensurate modulation q_b varies with temperature. q_b values here are given at the experimental base temperature of 10 K.

In Table II we summarize experimentally reported (Refs. 5–10) and theoretically optimized lattice parameters of bulk α -RMnO₃ (R =Gd, Tb, Ho, Er, Yb, Lu), which were discussed in Sec. V of the main text. Table III shows the experimentally measured (Refs. 3 and 4 and our measurements) and theoretically optimized lattice parameters of the corresponding strained films (see Sec. V of the main text). We provide .cif files for all theoretically optimized structures in Supplemental materials.

Table I. Experimentally acquired parameters of epitaxial α -RMnO₃ films. Thickness (t) and substrate normal (n) are controlled growth parameters. q_b is deduced from RXD experiments at the Mn L edges. Error estimates of q_b values are smaller than the last digit (unless otherwise indicated). Lattice constants were deduced in conventional XRD experiments.

II. EXCHANGE INTERACTIONS AND ANISOTROPIES

In Tables IV and V we summarize the Heisenberg (J_c , J_{ab} , J_a , J_{diag} , J_b and J_{3nn}), biquadratic (B_c and B_{ab}) and four-spin ring (K_c and K_{ab}) exchange interactions as well as the Dzyaloshinskii-Moriya interaction (DMI, γ_{ab} and α_c) and single ion anisotropy (A) parameters calculated using DFT for bulk samples and films of *o*-RMnO₃, respectively.

In Fig. 1 we present the calculated couplings J_a , J_{diag} , B_c , K_{ab} , γ_{ab} and α_c and anisotropies A versus the radius of the R cations for the bulk and film geometries.

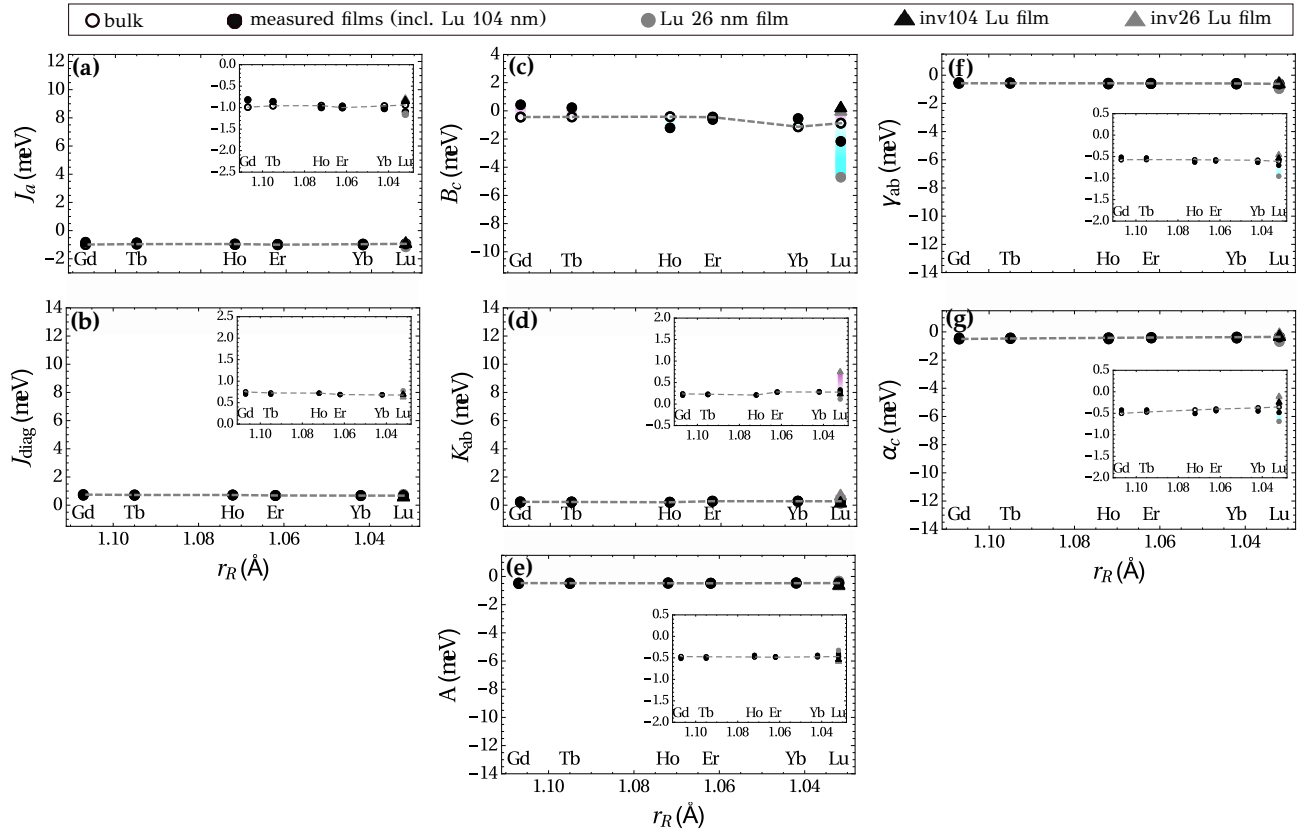

Figure 1. Calculated exchange couplings, components of DM vectors and anisotropy constants versus the radius of the R cation: (a) and (b) show the Heisenberg exchanges J_a and J_{diag} , respectively; (c) - biquadratic interplane exchanges B_c ; (d) - four-spin ring couplings K_{ab} ; (e) - SIA A ; (f) and (g) - the components of DM vectors γ_{ab} and α_c , respectively. Bulk samples are shown by the empty circles, experimentally measured strained films - by the filled circles. In most cases filled and empty circles are on top of each other. For LuMnO_3 the triangles denote the films which are compressively strained in the ac plane by the same amount (but opposite direction) as experimentally measured tensile strained films. LuMnO_3 26 nm film and corresponding inverse case are highlighted in gray, 104 nm and inv104 case - in black. Compressive strain within the ac planes of the $o\text{-RMnO}_3$ films shown by the violet color, tensile strain - by the blue color. Dashed line connecting the data points for the bulk $o\text{-RMnO}_3$ is used to guide eye.
