

Science Goals	Science Objectives	Scientific Measurement Requirements		Instrument Requirements	Projected performance	Mission Requirements
		Observables	Physical Parameters			
1.Measure the spin distribution of accreting black holes	Routinely measure black hole spin in three different ways: thermal continuum fitting in stellar mass BHs, reflection and reverberation mapping in stellar mass BHs and AGN, and high-frequency QPOs in stellar mass BHs	Continuum energy spectra, iron line, lag spectra, kHz QPO	Continuum & line sensitivity	XRCA Energy range: 0.2-12 keV XRCA Energy resolution 85-175 eV XRCA time resolution 100 ns XRCA effective area: 21,760 cm2 XRCA Background: 2.2 c/s XRCA FOV: 4 arcmin FWHM LAD energy range: 2-30 keV LAD Energy resolution: 200-300 eV FWHM LAD time resolution: 10 microseconds LAD Background:13 mcrab/1,486 c/s LAD Effective Area: 51,000 cm2 LAD FOV: 1 deg		Low-inclination orbit <14 deg Orbital altitude 500-600 km Rapid repointing capability high data rate 5-year mission Rapid alerts to ground
2. Understand the equation of state of dense matter	Measure the EOS for >10 pulsars to map the EOS and probe potential phase transitions	lightcurves from thermally emitting pulsars, light curves from burst oscillation sources, light curves from accreting pulsars	high resolution timing sensitivity			
3. Explore the properties of the precursors and electromagnetic counterparts of gravitational wave sources	A. Rapidly detect, localize, and characterize transients B. Rapidly alert the community to transient outbursts C. Monitor transient and variable sources	lightcurves and spectra from transient sources; sky locations of transient sources	sensitivity 600 mcrab (1s)/ 2 mcrab (1day) positional accuracy: 1 arcmin timing; spectral sensitivity	WFM Camera Pairs: 4 FOV/Camera Pair: 70 deg X 70 deg FWHM WFM Energy range: 2-50 keV WFM position accuracy: 1 arcmin WFM time resolution: 1 microsecond?; WFM energy resolution: 300 eV FWHM; WFM Eff. Area/ Camera Pair: 364 cm2
