

Science Goals	Science Objectives	Scientific Measurements	Driving Requirements
1.Measure the spin distribution of accreting black holes	1.1 Measure the spin distribution of accreting black holes	Thermal continuum	Energy range: 0.2–30 keV
		Reflection & X-ray reverberation	Energy resolution: 200 eV
		High frequency QPO	Time resolution: 100 microsec
		Transient outbursts	Effective Area: 20,000 cm^2
			Observe bright sources with full energy and time resolution
			Wide-field monitoring: 75% of sky, 5 mcrab (1 day) sensitivity, 1 keV energy resolution, 2 arcmin position accuracy
			ToO response (< 24 hours)
	1.2 Measure BH spin for 20 AGN to <10%	Reflection & X-ray reverberation	Energy range: 1–30 keV
		Jetted TDE detection	Energy resolution: 200 eV
			Effective Area: 20,000 cm^2
2. Understand the equation of state of dense matter	2.1 Measure the mass and radius to within 5-10% for ~20 pulsars to map the EOS and probe potential phase transitions	Pulse profile modeling for rotation powered pulsars, accretion powered pulsars, and thermonuclear burst oscillation sources	Effective area: 16,300 cm2 @ 1 keV/38,200 cm^2 @ 6 keV;
			Time resolution: 80 microsec
			Energy resolution: 85-175 eV FWHM (0.2-10 keV)
	2.2 Search for the fastest spinning pulsars	Search for spin frequencies up to 2 kHz	TOO response time: hours
			Time resolution: 50 microsec
3. Explore the properties of the precursors and electromagnetic counterparts of gravitational wave sources	3.1 Enable detection of 5–10 short gamma-ray bursts per year	Detect and localize w/ immediate trigger or ground searches	Wide-field monitor as above with 1ms time resolution
	3.2 Search for signatures of merging supermassive BH		
			All wide-field monitor data downlinked to ground
