

(a) OD window in two domains

(b) Convolution in Cartesian domain and translation equivariance

(c) Convolution in polar domain and rotation equivariance

— OC boundary      — OD boundary       $L_p$  : polar transformation

$\psi, \phi$  : convolution filters       $f, g$  : mappings from a pixel to a feature vector

$\Omega(\cdot)$  : neighboring pixels involving convolution

$\Omega_t(\cdot), \Omega_r(\cdot), \Omega_p(\cdot)$  : neighboring pixels involving convolution after  $L_t / L_r / L_p$

$\Omega_{p,r}(\cdot)$  : neighboring pixels involving convolution after rotation and polar transformation
