

potential origin

consequence

over-amplification

The model discriminates on a given human attribute beyond its source base-rate.

label bias

Biased annotations, interaction, or latent bias from past classifications.

outcome disparity

The distribution of outcomes, given attribute A , is dissimilar than the *ideal distribution*:

$$Q(\hat{Y}_t|A) \neq P(Y_t|A)$$

Embedding Corpus

X_{target}

(Application Side)

predict

biased outcomes

\hat{Y}_{target}

semantic bias

Non-ideal associations between attributed lexeme (e.g. gendered pronouns) and non-attributed lexeme (e.g. occupation).

selection bias

The sample of observations themselves are not representative of the application population.

error disparity

The distribution of error (ϵ) over at least two different values of an attribute (A) are unequal:

$$Q(\epsilon_t|A_i) \neq Q(\epsilon_t|A_j)$$
