

over-amplification
The model discriminates on a given human attribute beyond its source base-rate.

label bias
Biased annotations, interaction, or latent bias from past classifications.

outcome disparity
The distribution of outcomes, given attribute A , is dissimilar than the *ideal distribution*:
 $Q(\hat{Y}_t|A) \neq P(Y_t|A)$

semantic bias
Non-ideal associations between attributed lexeme (e.g. gendered pronouns) and non-attributed lexeme (e.g. occupation).

selection bias
The sample of observations themselves are not representative of the application population.

error disparity
The distribution of error (ϵ) over at least two different values of an attribute (A) are unequal:
 $Q(\epsilon_i|A_i) \neq Q(\epsilon_i|A_j)$
