

origin
consequence

over-amplification
The model discriminates on a given human attribute beyond its source base-rate.

label bias
Biased annotations, interaction, or latent bias from past classifications.

outcome disparity
The distribution of outcomes (given an attribute) is dissimilar than the ideal distribution:
 $Q(\hat{Y}_t|A) \neq P(Y_t|A)$

semantic bias
The representation of linguistic meaning (e.g. words) have undesirable attribute associations.

selection bias
The sample of observations themselves are not representative of the application population.

error disparity
The distribution of error (ϵ) is inconsistent over different values of an attribute (A):
 $Q(\epsilon_t|A) \neq Uniform$
