

**over-amplification**  
The model discriminates on a given human attribute beyond its source base-rate.

**label bias**  
Biased annotations, interaction, or latent bias from past classifications.

**outcome disparity**  
The distribution of outcomes (given an attribute) is dissimilar than the ideal distribution:  
 $Q(\hat{Y}_t|A) \neq P(Y_t|A)$

**semantic bias**  
The representation of linguistic meaning (e.g. words) have undesirable attribute associations.

**selection bias**  
The sample of observations themselves are not representative of the application population.

**error disparity**  
The distribution of error ( $\epsilon$ ) is inconsistent over different values of an attribute ( $A$ ):  
 $Q(\epsilon_t|A) \neq Uniform$
