Abnormal EEG; awake and drowsy states due to the presence of 1) Generalized theta slowing of the background 2) Intermittent focal delta slowing over the right temporal region. No epileptiform abnormalities or organized electrographic seizures were detected.

Epileptiform abnormalities were seen. Generalized slowing was not observed. Focal Slowing slowing was seen.

Abnormal EEG. Drowsy EEG present. Generalized theta slowing of the background. Focal slowing over the right temporal region. No epileptiform were detected.

This is an abnormal EEG. Drowsy states were observed. Awake states were seen. Generalized theta slowing of the background was present. Focal delta slowing was seen. Epileptiform abnormalities were not seen. Electrographic seizures were not detected.

IMPRESSION: Abnormal EEG; recorded in awake; drowsy and sleep states due to modest voltage attenuation over the left anterior quadrant. No epileptiform abnormalities and no organized electrographic seizures were detected

EEG is not normal. This EEG is generalized slowing present. No seizures were detected.

Abnormal EEG was seen. Generalized slowing was present in .There were no seizures. No. Epileptiform discharges. Sleep stages were see..

Abnormal EEG was seen. Generalized slowing was present in the recording .There were no seizures observed. Epileptiform discharges were not observed. Drowsy states were seen. Sleep stages were present anterior quadrant.
