

# Wake

**Objective:** For each task  $x$  in  $X$ , find best program  $\rho_x$  solving  $x$  under current library  $L$

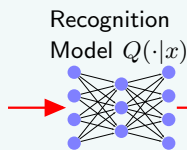

## Library $L$

$f_1(x) = (+ \ x \ 1)$   
 $f_2(z) = (\text{fold cons}$   
      $(\text{cons } z \ \text{nil}))$   
 .....

## Task $x$

$[7 \ 2 \ 3] \rightarrow [4 \ 3 \ 8]$   
 $[3 \ 8] \rightarrow [9 \ 4]$   
 $[4 \ 3 \ 2] \rightarrow [3 \ 4 \ 5]$

Recognition  
Model  $Q(\cdot|x)$

## Neurally guided search

Propose programs  $\rho$  in decreasing order under  $Q(\cdot|x)$  until timeout

**Best program  $\rho_x$  for task  $x$**   
 $(\text{map } f_1 \ (\text{fold } f_2 \ \text{nil } x))$

Choose  $\rho_x$  that maximizes:  
 $P[\rho|x, L] \propto P[x|\rho] P[\rho|L]$

# Sleep: Abstraction

**Objective:** Grow library  $L$  to compress programs found during waking

**program for task 1**  
 $(\text{cons } (+ \ 1 \ 1))$

**program for task 2**  
 $(+ \ (\text{car } z) \ 1)$

## Refactoring

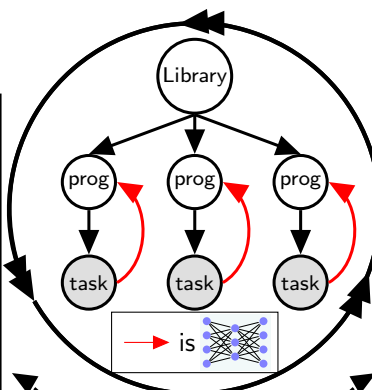

Propose new library routines from subtrees of refactorings of programs

**New library  $L$**   
 w/ routine  $(+ \ x \ 1)$

Expand  $L$  w/  
the routine that  
maximizes:

$$P[L] \prod_{x \in X} \max_{\rho: \text{refactorings of } \rho_x} P[x|\rho] P[\rho|L]$$

Repeat  
until no  
increase  
in score

# Sleep: Dreaming

**Objective:** Train recognition model  $Q(\rho|x)$  to predict best programs  $\rho_x$  for typical tasks  $x$  and current library  $L$

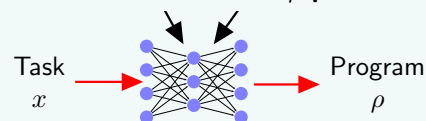

## Fantasies

1. draw programs  $\rho$  from library  $L$
2. set task  $x$  to output of executing  $\rho$

## Replays

1. recall tasks  $x$  solved in waking
2. set program  $\rho$  to retrieved solution  $\rho_x$

## Train network on $x, \rho$ pairs

Gradient step in parameters of  $Q$   
to maximize  $\log Q(\rho|x)$

Train  
until  
converged
