

Loss function

Theoretical knowledge

$$L_{\text{opt}} = \mathbb{E}_{\mathbf{s}} [F(\mathbf{s}, \mathbf{u}(\mathbf{s}))] + \sum_{i=1}^I \lambda_i^{\text{G}} \mathbb{E}_{\mathbf{s}} [G_i^{\text{ave}}(\mathbf{s}, \mathbf{u}(\mathbf{s}))] + \sum_{j=1}^J \int_{\mathbf{s} \in D_{\mathbf{s}}} v_j^{\text{G}}(\mathbf{s}) G_j^{\text{ins}}(\mathbf{s}, \mathbf{u}(\mathbf{s})) d\mathbf{s}$$

Policy (optimized in the primal domain)

Weighting coefficients of constraints (optimized in the dual domain)

Detailed description: The diagram shows the equation for the optimal loss function  $L_{\text{opt}}$ . It is composed of three terms: an expected value of a function  $F$ , a sum of expected values of functions  $G_i^{\text{ave}}$  weighted by  $\lambda_i^{\text{G}}$ , and a sum of integrals of functions  $G_j^{\text{ins}}$  weighted by  $v_j^{\text{G}}$ . Annotations include: a red arrow pointing from 'Policy (optimized in the primal domain)' to the  $\mathbf{u}(\mathbf{s})$  terms; a blue arrow pointing from 'Weighting coefficients of constraints (optimized in the dual domain)' to the  $\lambda_i^{\text{G}}$  and  $v_j^{\text{G}}$  terms; and a dashed line connecting 'Theoretical knowledge' to the expectation and integral operators.
