

(1) Molecular graph message passing

Initial node embeddings for the DAG are created by running GNNs on node's molecular graphs

(2) Synthesis graph message passing.

- i. **Messages** passed forward on DAG ii. **Update** node representations iii. Repeat!

$$\begin{matrix} \text{[Embedding]} \\ = ge(\text{[Embedding]}, \text{[Embedding]}) \\ m_M \quad c \end{matrix}$$

Update node embeddings

$$\begin{matrix} \text{[Embedding]} \\ = gm(\text{[Embedding]}, \text{[Embedding]}, \text{[Embedding]}) = \text{Lin}_1(\text{[Embedding]}) + \text{Lin}_1(\text{[Embedding]}) \\ m_M \quad c \quad a \quad b \end{matrix}$$

Compute **messages**
