:3]) [c:4] 1 [cH:5] [c:6] ([C:7] (= [O:8]) [OH:9]) [cH:10] [cH:11] [c:12  
] 1 [NH:15] [CH3:14] 12-13;12-15
```

...

1.

Remove atom-mappings and reagents so that we have a list of reactions, where each reaction is a mapping from a set of reactants to one product molecule.

2.

Build up reaction network by starting from specified building blocks then repeatedly iterating through the available reactions and adding any that can be made from molecules already existing in the graph.

3.

Create synthesis DAG by picking each intermediate product in turn and searching back through the reaction network until we have found a sub-graph that starts from building blocks only.

4.
