

1. Matrix-based Distance Measurement: The paper proposes a matrix-based method that effectively captures the differences in Pythagorean fuzzy sets by considering the hesitance index and rationally distributing its weight between membership and non-membership.
2. Avoids Counter-intuitive Results: The proposed method avoids producing counter-intuitive results, proving to be more reasonable and efficient than previous methods in practical applications.
3. Real-world Application and Superiority: Applied to real-world scenarios, the method demonstrates superiority and efficiency over previous methods, particularly in medical diagnosis.
4. Compliance with Distance Measurement Axioms: The method satisfies the axioms of distance measurement, including symmetry, non-negativity, and the triangle inequality, ensuring consistency and rationality.
