

The diagram illustrates a Petri net model for a controller and an ejector. The Controller component includes places for tokens (tokenin, tokenout), workpieces (wpin, wpin), and events (ejstart, ejend). It features transitions for tokenin, tokenout, wpin, and ejstart. The Ejector component includes places for ejstart and ejend, with transitions for ejstart and ejend. The initial state is defined by the number of tokens in each place: 1 token in tokenin, 3 tokens in tokenout, 2 tokens in wpin, and 1 token in ejstart. The transitions are labeled with numbers 1 through 4, indicating specific actions or events. The Controller transitions are labeled 1, 2, 3, and 4, while the Ejector transitions are labeled 1 and 2.
