REFORM
DESIGN

Input data to material flow analysis (MFA) for flow circularity

Addressed questions

Cloud servers

What is the **amount** of a critical material currently accumulated in a city/country?

What **types** of raw material are accumulated in a city/country?

The diagram illustrates the architecture and applications of a Sensor network. At the bottom, a box labeled "Material measurements" is connected by a blue arrow to a box labeled "Sensor network". A blue arrow also points upwards from the "Sensor network" box. To the left of the "Material measurements" box is a blue bracket with a "D" symbol. From the "Sensor network" box, two orange arrows point to the right: one to "MMUs implemented on" and another to "MMUs implemented for". The "MMUs implemented on" text is followed by an orange arrow pointing to "Edge devices". The "MMUs implemented for" text is followed by five orange arrows pointing to a list of applications: "Airport conveyor belts", "Smart bins", "Sorting centres", "Smartphones", and "Smart trucks". From the "Material measurements" box, an orange arrow points to the word "Types", which is followed by three orange arrows pointing to a list of material types: "Material class", "Material mass", and "Geographical location".

```
graph TD; MM[Material measurements] -- blue arrow --> SN[Sensor network]; SN -- blue arrow --> Out[ ]; SN -- orange arrow --> MMU1[MMUs implemented on]; SN -- orange arrow --> MMU2[MMUs implemented for]; MMU1 -- orange arrow --> ED[Edge devices]; MMU2 -- orange arrow --> A1[Airport conveyor belts]; MMU2 -- orange arrow --> A2[Smart bins]; MMU2 -- orange arrow --> A3[Sorting centres]; MMU2 -- orange arrow --> A4[Smartphones]; MMU2 -- orange arrow --> A5[Smart trucks]; MM -- orange arrow --> T[Types]; T -- orange arrow --> TC[Material class]; T -- orange arrow --> TM[Material mass]; T -- orange arrow --> TL[Geographical location];
```

Material measurements

Sensor network

MMUs implemented on

Edge devices

MMUs implemented for

Airport conveyor belts

Smart bins

Sorting centres

Smartphones

Smart trucks

Types

Material class

Material mass

Geographical location

The diagram illustrates a 3D scene understanding system architecture. A central box labeled **Model** is the core component. It is connected to several other components:

- Components**: This category includes:
 - Object classifier
 - Material classifier
 - Volume estimator
- Techniques**: This category includes:
 - Hand-crafted features
 - Feature learning
- Scene Segmentation**: This category includes:
 - Scene segmenter
 - Depth estimator

The **Model** box is also connected to a **MM** (Machine Learning) box on the left and a **GPU** box on the right, indicating its reliance on these resources. The **Model** box is highlighted with a green border, and the **Components** and **Techniques** boxes are highlighted with orange borders.
