

Method Goals

Method Goal: Gain insight into a trained ML model

Method Goal: Describe model behavior using feature relationships

Method Goal: Describe the influence/importance of training points

Method Goal: Determine what features are most important for the model to observe/have access to.

Method Goal: Given some prediction(s), describe how a different outcome could be achieved.

Method Goal: Describe how the model behaves in a certain region of the input space

Global FA
When features are present or missing, how does this affect the model's aggregate predictions or performance?

Local FA
When features are present or missing, how does this affect a specific prediction?

Global CF
What (low cost) changes can be made to this group of points to achieve a desired outcome?

Local CF
What (low cost) changes can be made a specific point to achieve a desired outcome?

Global AP
How can I summarize the model as a whole by approximating its predictions with a simpler model?

Local AP
How can I summarize the model by approximating its predictions in a neighborhood around a point?

Global SI
What training points are most influential on the model's parameters or aggregate performance?

Local SI
What training points are most influential on a specific prediction?

Method Clusters
Technical Objectives (TOs)
