

Example Object, size (3,NK,NK)

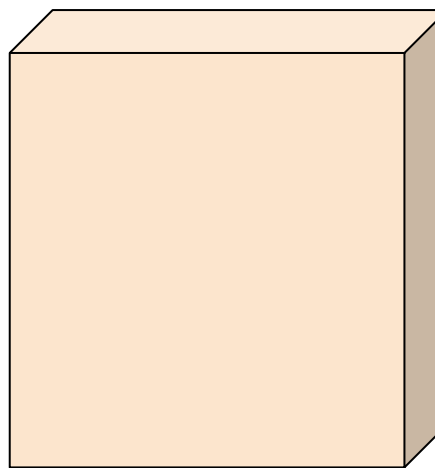

Target regions (3,
H, W)

Split into K^2 kernels, size
($K^2, 3, N, N$)
(Layer 1 weights)

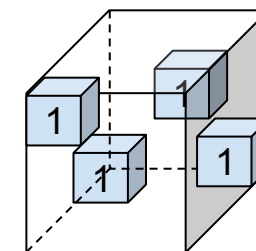

Conv2D

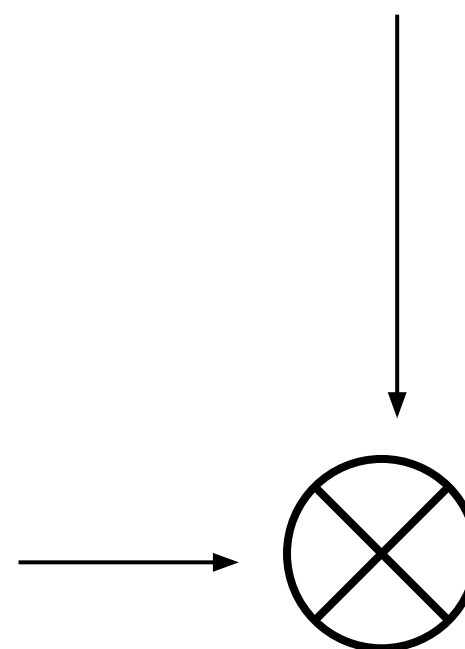

Layer 1 Feature Maps (K^2 ,
 H' , W')

This kernel effectively
merges the scores of 4
neighboring patches into
a larger patch

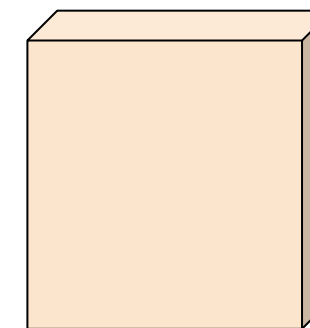

Structural sparse weights, size
($K^2/4$, K^2 , $K/2+1$, $K/2+1$)

..... (Repeat $K^2/4$
times for different
channels)

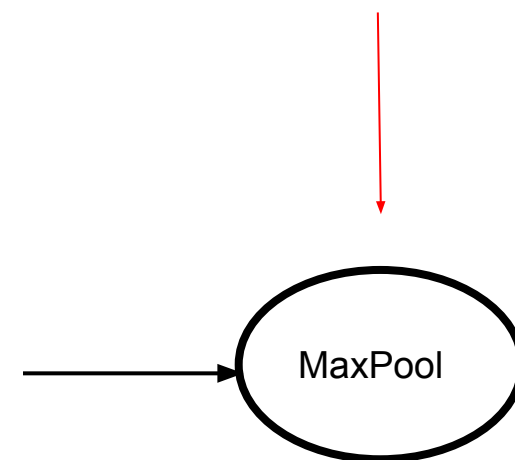

Conv2D

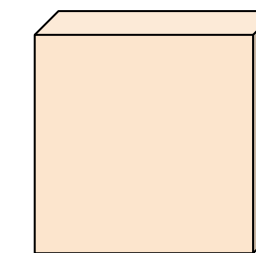

Layer 2 Feature
Maps
($K^2/4$, H'' , W'')

Max pooling makes
model robust to distortion
and scale change

.....
Repeat

Final Score Map
(1, H_x , W_x)
