

“Conv to Flat to Fully Connected”
Regression Archetype

Regresses T from flattened $\mathcal{F}(I^A \oplus I^B)$
or $\mathcal{F}(I^A) \oplus \mathcal{F}(I^B)$

Assume
 $T \circ I^A = I^B$

Equivariant Filters to Closed Form Reg.
(Proposed Method)

Constructed s.t. $\mathcal{F}(T \circ I) = T \circ \mathcal{F}(I)$ $\left. \vphantom{\mathcal{F}(T \circ I) = T \circ \mathcal{F}(I)} \right\} \rightarrow \hat{T} = \arg \min_T \sum_k \|Tx_k^A - x_k^B\|_2^2$
 $Tx_k^A \approx x_k^B$ for $k \in [K]$
