

## Supplemental Material: Search for a Higgs portal scalar decaying to electron-positron pairs in the MicroBooNE detector

The MicroBooNE signal selection efficiency, 95% confidence level upper limits and sensitivities for the Higgs portal model parameter  $\theta$  for a range of scalar boson masses below twice the muon mass are presented in Table I. The limits are also available in the text file `limits.txt` alongside this document.

TABLE I. Signal selection efficiency for a scalar boson decaying inside the TPC. Observed and expected (median,  $\pm 1, 2$  standard deviation ( $\sigma$ )) 95% CL upper limits on the Higgs portal parameter  $\theta$  for several scalar boson masses.
