Underlying Causal Graph

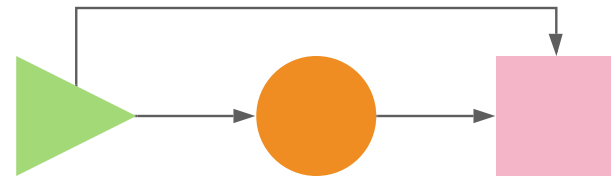

Where should this new object be placed in the causal graph?

Even if the model hasn't seen this shape and/or color, it should still be able to insert it in the graph correctly

Increasing weight →

Underlying Causal Graph

The model hasn't seen this shape before but it has seen red color before. So it should still be able to insert the object in the above causal graph

The model hasn't seen this color before. So it will not be able to insert this object in the above causal graph without performing some interventions
