

# Architectures of Meaning: A Systematic Corpus Analysis of NLP Systems

## Appendix

Lexicon of Section Headings:

Headings containing words *introduction*, *related*, *previous*, *background*, *literature*, *of the art*, and words: *results*, conclusions were associated with sections considered as the *opening* and the *end* of the paper, respectively. As both of them are likely to mention previous works/systems, only the sections between *opening* and end were processed further (note: as a result the *title*, abstract and *references* were removed as well).

Pre-processing Heuristics:

Blocks were merged into one block of text (one per paper) and pre-processed using the filters: removed sentences containing a word *baseline*, removed punctuation, lower cased, removed double spaces and line breaks. In each text the algorithm searches for an exact string match with an entity in the lexicon.

To each entity string white spaces from both sides were added ('lstm' to ' lstm '), in order to eliminate substrings detection (e.g. 'lstm' in 'bilstm'). Each entity was also checked in the plural.

Automatic Extraction:

Using our algorithm we were able to extract text from 96.3\% of the target papers (1039 out of 1079). In 40 cases the text was extracted manually. Although sections like *Introduction*, *Related Work*, *Results* and *Conclusions* were excluded from the search, detection of baselines or models developed in previous studies/years is possible. One obvious reason is that the key section with description of a newly proposed model contains comparison to previous models. Another reason is the possibility of finding 'related work' sections both at the beginning and at the end of the paper, as the sections order in the paper is not strictly imposed. Finally, components are taken out of context and negations are counted equally to the true usage.

### 1. Top 100 Components from SemEval 2019

No	Component	Coefficient	R2
1	LSTM	0.147	0.95
2	Word Embeddings	0.125	0.911

3	embedding layer	0.108	0.969

### 3. List of SemEval tasks (2012 – 2019)

Based on task description, we group each SemEval task within a task type. Then, due to a large number of task types, these were further clustered within 6 task groups:

- Sentiment Analysis (SA)
- Machine Translation (MT)
- Question Answering (QA)
- Information Extraction (IE) – information extraction, temporal information extraction, argument mining, fact checking
- Semantics Analysis (SEM) – semantic analysis, semantic difference, semantic inference, semantic role labeling, semantic parsing, semantic similarity, relational similarity
- Other (OT) – hypernym discovery, entity linking, lexical simplification, word sense disambiguation, taxonomy extraction, taxonomy enrichment

Task ID	Full Name	Citations	Task Type	Task Group
2012_01	1. English Lexical Simplification <sup>1</sup>	103	lexical simplification	OT
2012_02	2. Measuring Degrees of Relational Similarity <sup>2</sup>	122	relational similarity	SEM
2012_03	3. Spatial Role Labeling <sup>3</sup>	39	information extraction	IE
2012_04	4. Evaluating Chinese Word Similarity <sup>4</sup>	35	semantic similarity	SEM
2012_05	5. Chinese Semantic Dependency Parsing <sup>5</sup>	16	semantic parsing	SEM
