

Start with original train Data  
 $D_{\text{train}} = \{\mathbf{x}_j, y_j\}_{j=1}^{N_{\text{tr}}}$

find optimal subset of features based on filter methods:

$\theta_F$

$\theta_S$

$\theta_M$

$\theta_P$

$\theta_K$

$D_{\text{train}}^{(\theta_F)}$

$D_{\text{train}}^{(\theta_S)}$

$D_{\text{train}}^{(\theta_M)}$

$D_{\text{train}}^{(\theta_P)}$

$D_{\text{train}}^{(\theta_K)}$

Construct new train data  
based on the optimal  
subset of features

Find optimal subset of features based on SFS method:

$\theta_{\text{SVC\_poly}}$

$\theta_{\text{SVC\_rbf}}$

$\theta_{\text{DT}}$

$\theta_{\text{LR}}$

$\theta_{\text{RF}}$

$D_{\text{train}}^{(\theta_{\text{SVC\_poly}})}$

$D_{\text{train}}^{(\theta_{\text{SVC\_rbf}})}$

$D_{\text{train}}^{(\theta_{\text{DT}})}$

$D_{\text{train}}^{(\theta_{\text{LR}})}$

$D_{\text{train}}^{(\theta_{\text{RF}})}$

Bootstrap: generate 100 bootstrap train data by re-sampling from the obtained reduced order database  $D_{\text{train}}^{(\theta_x)}$

$D_{\text{train}}^{(\theta_F, b)}$

$D_{\text{train}}^{(\theta_S, b)}$

$D_{\text{train}}^{(\theta_M, b)}$

$D_{\text{train}}^{(\theta_P, b)}$

$D_{\text{train}}^{(\theta_K, b)}$

Generated bootstrap  
data  $b = 1, \dots, 100$

$D_{\text{train}}^{(\theta_{\text{SVC\_poly}}, b)}$

$D_{\text{train}}^{(\theta_{\text{SVC\_rbf}}, b)}$

$D_{\text{train}}^{(\theta_{\text{DT}}, b)}$

$D_{\text{train}}^{(\theta_{\text{LR}}, b)}$

$D_{\text{train}}^{(\theta_{\text{RF}}, b)}$

- For each bootstrap data  $D_{\text{train}}^{(\theta_x, b)}$  obtained from *filter methods*, use different classifier (SVM\_poly, SVM\_rbf, DT, LR, RF) to fit a model and then evaluate performance of the model on the corresponding reduced order test data,  $D_{\text{test}}^{(\theta_x)}$ , and report the result.
- For each bootstrap data  $D_{\text{train}}^{(\theta_x, b)}$  obtained from *SFS method*, use the corresponding classifier (which is used in feature selection) to fit a model, and then evaluate performance of the model on corresponding reduced order test data,  $D_{\text{test}}^{(\theta_x)}$ , and report the result.
