

Federated Spectrum Learning (FSL)

```
graph TD; FSL[Federated Spectrum Learning (FSL)] --> S1[Stage-1: RIS-aided resource allocation (RISs-enabled cooperative spectrum sensing)]; FSL --> S2[Stage-2: RIS-aided FL training (RISs improve wireless transmission)]; S1 --> P1(Better performance of optimization); S2 --> P2(Higher accuracy of FL prediction); P1 --> P2; P2 --> P1; P1 --- Interplay[Interplay]; P2 --- Interplay;
```

The diagram illustrates the Federated Spectrum Learning (FSL) process. It begins with a top-level box labeled 'Federated Spectrum Learning (FSL)'. This box branches into two parallel stages: 'Stage-1: RIS-aided resource allocation (RISs-enabled cooperative spectrum sensing)' and 'Stage-2: RIS-aided FL training (RISs improve wireless transmission)'. Stage 1 leads to 'Better performance of optimization', and Stage 2 leads to 'Higher accuracy of FL prediction'. These two outcomes are connected by a circular arrow loop, with the word 'Interplay' in the center, indicating a synergistic relationship between the two stages.

Stage-1:

RIS-aided resource allocation
(RISs-enabled cooperative
spectrum sensing)

Stage-2:

RIS-aided FL training
(RISs improve
wireless transmission)

Better performance
of optimization

Interplay

Higher accuracy
of FL prediction
