

→ angle satisfies,  $\sin(\delta/2) = \frac{\|\theta^* - \hat{\theta}\|_2}{2}$

$$h = \sin(\delta) \leq 2 \sin(\delta/2) = \|\theta^* - \hat{\theta}\|_2$$

since  $\sin(\cdot)$  is concave around 0.

$\therefore$  spherical cap around  $\hat{\theta}$   
of height  $h = \|\theta^* - \hat{\theta}\|_2$   
is contained in hemisphere  
around  $\theta^*$ .
