

Batch sampling

a) Traditional Regularization

$$R = \text{dist}(\text{blue square}, \text{yellow square}) + \text{dist}(\text{blue square}, \text{green square}) + \dots + \text{dist}(\text{green square}, \text{red square})$$

b) Our Regularization

$$R = \text{dist}(\text{blue square}, \text{green square}, \text{yellow square}, \text{red square}), \text{blue square}, \text{green square}, \text{yellow square}, \text{red square})$$

New random mixtures at each step

$$\text{Loss} = \mathcal{L}(\text{blue square}, \text{yellow square}, \text{green square}, \dots, \text{red square}) + \lambda \cdot R$$
