1 Data on calculations of parity-violating rotational constant shifts and of nuclear electric quadrupole coupling tensors

In the following all computed molecular structures, the corresponding rotational constants, Re-ligand distances, NEQC tensors for ^{14}N and ^{187}Re , PV energy shifts, PV energy gradients and harmonic force fields are given.

Table S1: Nuclear cartesian coordinates of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(^{14}\text{NO})$ optimized at Hartree–Fock and density functional theory levels including the PBE, PBE0 and B3LYP exchange correlation functional. Calculations were performed on the one-component level with relativistic effective core potential (RECP), employing the basis sets cc-pV5Z on H, C, N and O and cc-pwCVQZ-PP on Re (cc5Z) or def2-TZVPP (def3Z) on all atoms and on the two-component zeroth order regular approximation (ZORA) level employing the all-electron basis sets x2c-TZVPPall-2c (x2c3Z). All coordinates in Å.

Table S2: Rotational constants of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(^{14}\text{NO})$ for the ^{187}Re nucleus at different levels of theory compared to those experimentally observed in Ref. 1. Hartree–Fock and DFT calculations including the LDA, PBE, PBE0 and B3LYP exchange correlation functional were performed at the RECP and two-component ZORA levels for the optimization of the molecular structure employing the basis sets x2c-TZVPPall-2c (x2c3Z), cc-pV5Z on H, C, N and O and cc-pwCVQZ-PP on Re (cc5Z) and def2-TZVPP (def3Z). Calculations with the x2c3Z basis set are on the two-component ZORA level and calculations with the cc5Z and def3Z basis sets are on the RECP level.

Table S3: Distance $d(\text{Re} - \text{X})$ of the ligands $\text{X} = \text{Cp}, \text{CH}_3, \text{CO}, \text{NO}$ from the ^{187}Re nucleus in $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(^{14}\text{NO})$ at different levels of theory compared to those observed by X-ray diffraction in Ref. 1. Hartree–Fock and DFT calculations including the LDA, PBE, PBE0 and B3LYP exchange correlation functional were performed at the RECP and the two-component ZORA levels for the optimization of the molecular structure employing the basis sets x2c-TZVPPall-2c (x2c3Z), cc-pV5Z on H, C, N and O and cc-pwCVQZ-PP on Re (cc5Z) and def2-TZVPP (def3Z). Calculations with the x2c3Z basis set are on the ZORA level and calculations with the cc5Z and def3Z basis sets are on the RECP level. The distance $d(\text{Re} - \text{Cp})$ is computed as the distance between Re and the center of mass of the Carbon atoms of the Cp-ring. In the last column, the mean absolute error to experimental data is shown.

Method	$d(\text{Re} - \text{X})/\text{pm}$				MAE

Table S4: Nuclear electric quadrupole coupling tensors of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(^{14}\text{NO})$ for the ^{187}Re nucleus in the principal axes system at different levels of theory. Hartree-Fock and DFT calculations including the LDA, PBE, PBE0 and B3LYP exchange correlation functional were performed at the RECP and two-component ZORA levels for the optimization of the molecular structure employing the basis sets x2c-TZVPPall-2c (x2c3Z), cc-pV5Z on H, C, N and O and cc-pwCVQZ-PP on Re (cc5Z) and def2-TZVPP (def3Z). Calculations with the x2c3Z basis set are on the ZORA level and calculations with the cc5Z and def3Z basis sets are on the RECP level. The electron density was computed at the level of ZORA with the x2c-TZVPPall-2c basis set for H, C, N and O and an even-tempered basis set on Re including 25 s, 25 p, 14 d, 11 f, and 3 g functions. The NEQC tensors with different methods are presented alongside the relative deviation to the tensor components of the experimental NEQC tensor of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(^{14}\text{NO})$ measured in Ref. 1. In the last three columns the asymmetry η of the NEQC tensor, the relative average deviation (RAD) to the experiment and the relative maximum deviation (RMD) to the experiment of all tensor components are shown. The value for the nuclear electric quadrupole moment of ^{187}Re suggested in Ref. 2 $eQ = 2.070b$ was used in all calculations.

Method		Structure	Density	χ_{aa}/MHz	$\Delta\chi_{aa}/\%$	χ_{bb}/MHz	$\Delta\chi_{bb}/\%$	χ_{cc}/MHz	$\Delta\chi_{cc}/\%$	χ_{ab}/MHz	$\Delta\chi_{ab}/\%$	χ_{ac}/MHz	χ_{bc}/MHz	$\Delta\chi_{ac}/\%$	η	RAD/%	RMD/%

Table S5: Nuclear electric quadrupole coupling tensors of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(^{14}\text{N}\text{O})$ for the ^{14}N nucleus in the principal axes system at different levels of theory. Hartree-Fock and DFT calculations including the LDA, PBE, PBE0 and B3LYP exchange correlation functional were performed at the RECP and two-component ZORA levels for the optimization of the molecular structure employing the basis sets x2c-TZVPPall-2c (x2c3Z), cc-pV5Z on H, C, N and O and cc-pwCVQZ-PP on Re (cc5Z) and def2-TZVPP (def3Z). Calculations with the x2c3Z basis set are on the ZORA level and calculations with the cc5Z and def3Z basis sets are on the RECP level. The electron density was computed at the level of ZORA with the x2c-TZVPPall-2c basis set for H, C, N and O and an even-tempered basis set on Re including 25 s, 25 p, 14 d, 11 f, and 3 g functions. The NEQC tensors at different methods are presented alongside the relative deviation to the tensor components of the experimental NEQC tensor of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(^{14}\text{N}\text{O})$ measured in Ref. 1. In the three last columns the asymmetry η of the NEQC tensor, the relative average deviation (RAD) to the experiment and the relative maximum deviation (RMD) to the experiment of all tensor components are shown. The value for the nuclear electric quadrupole moment of ^{14}N suggested in Ref. 2 $eQ = 0.020\text{b}$ was used in all calculations.

Method		Density	χ_{aa}/MHz	$\Delta\chi_{aa}/\%$	χ_{bb}/MHz	$\Delta\chi_{bb}/\%$	χ_{cc}/MHz	$\Delta\chi_{cc}/\%$	χ_{ab}/MHz	χ_{ac}/MHz	χ_{bc}/MHz	η	RAD/%	RMD/%

2 Computational details and data of calculations of PV shifts in vibrational spectra

The equilibrium structure of (*R*)- $\text{CpRe}(\text{CH}_3)(\text{CO})(\text{NO})$ is taken from the earlier study by Schnell and coworkers¹. Structure optimizations and harmonic force field calculation were performed at B3LYP level of theory with the Gaussian 09 program package,³ using the correlation consistent polarized quintuple zeta basis set (cc-pV5Z) on period 1-3 atoms (H, C, N and O) whereas the cc-pwCVQZ-PP basis set and an energy-consistent pseudo-potential of the Stuttgart group^{4,5} were employed on rhenium atom. Calculations of anharmonic vibrational force fields were performed on the above optimized structure employing a hybrid approach⁶ within the Gaussian program package assuming that the normal modes from two levels of theories are similar. Harmonic force field data at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level was utilized for the computation of anharmonic contributions at a lower level. The latter have been computed at B3LYP level using the scalar relativistic Stuttgart pseudo potential together with an energy-optimized valence basis set with a (12s11p10d8f)/[8s7p6d4f] contraction on Re atom⁷ and cc-pVDZ basis set for H, C, N and O atoms.

Subsequently, PV energies were calculated as described in the computational details section at fixed nuclear coordinates for (*R*)- $\text{CpRe}(\text{CH}_3)(\text{CO})(\text{NO})$ containing either ^{187}Re or ^{185}Re isotopes of Re. According to the procedure described in Ref. 8, a one-dimensional cut through the PV potential hypersurfaces $E_{PV}(\vec{q})$ along the dimensionless reduced normal coordinate q_9 and q_{10} corresponding to the $-\text{CO}$ and $-\text{NO}$ stretching modes of (*R*)- $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ and (*R*)- $\text{Cp}^{185}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ are approximated. Due to the choice of phase in the computation of dimensionless reduced normal coordinates a bond expansion is observed for N–O bond in the direction $q_{10} = -3.0$ to $q_{10} = 3.0$, whereas a bond compression for the C–O stretching vibration is observed in the direction of $q_9 = -3.0$ to $q_9 = 3.0$. Figure S1 depicts the variation of the parity conserving and parity violating energies along the respective dimensionless reduced normal coordinates. Both of the coordinates are aligned from bond compression (left) to bond expansion (right) so that the abscissa read as q_{NO} and $-q_{CO}$. The variation of parity violating energies are similar for LDA, BLYP and B3LYP levels, whereas the curves for HF is far from the DFT ones, indicating that the HF method may not be very useful for compounds containing transition metals such as Re.

The current work employs a perturbative approach⁹ for estimating the relative PV vibrational frequency splittings in the enantiomers of $\text{CpRe}(\text{CH}_3)(\text{CO})(\text{NO})$ where the PC and PV potentials are expanded in a Taylor series. In this, the influence of multi-mode effects¹⁰⁻¹³ are estimated by the calculations of the derivatives of the PV potentials with

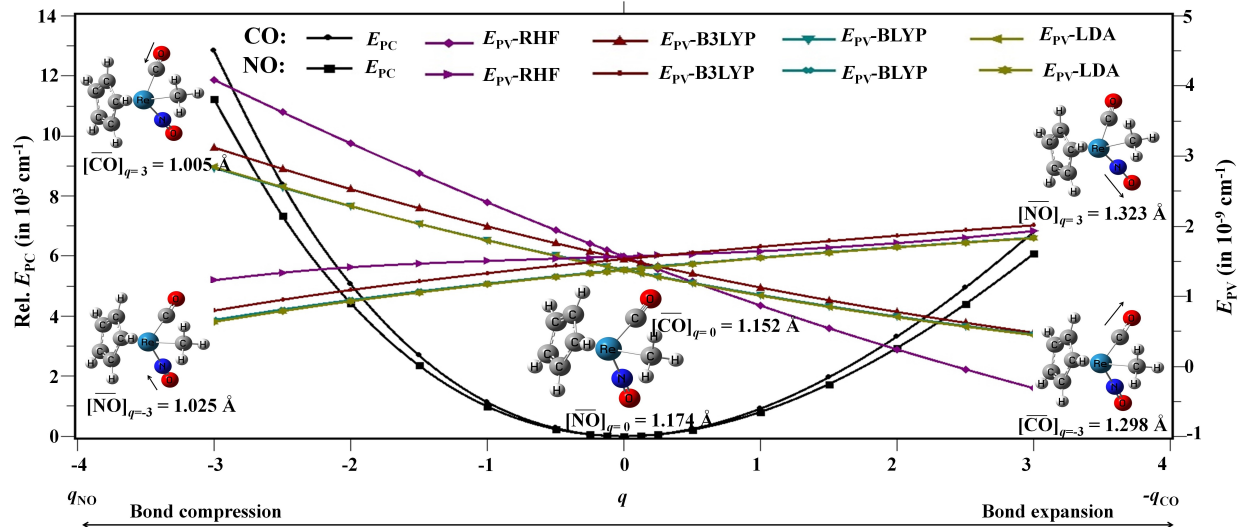

Figure S1: Variation of the parity conserving and parity violating energies along the dimensionless reduced normal coordinates of q_9 and q_{10} for $(R)\text{-Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ structure optimized at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory.

respect to all normal coordinates as described in our recent paper 10. The second derivatives of the PV potential $\frac{\partial^2 E_{PV}}{\partial q^2}$ are computed semi-numerical from a linear fit of $\frac{\partial E_{PV}}{\partial q}$ evaluated at three points (viz. $q = -0.125, 0.0$ and $+0.125$) close to the minimum.

Table S15: Cartesian displacements (in Å) corresponding to a unit shift along the dimensionless reduced normal coordinates for ν_9 and ν_{10} of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ from the molecular structure optimized at the level RECP-B3LYP/cc-pV5Z,cc-pwCVQZ-PP.

Table S19: Unscaled harmonic and anharmonic wavenumbers $\tilde{\omega}$ (in cm^{-1}) and corresponding anharmonic intensities (in km/mol) for the overtone bands as obtained for the equilibrium structure of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$. B3LYP/cc-pV5Z,cc-pwCVQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)/[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Masses used (in u) for the harmonic force field calculation are 1.008, 12.000, 14.003, 15.995, 184.953, and 186.956 respectively for H, C, N, O, ^{185}Re and ^{187}Re atoms.

^c 2D effects = (Perturbed 2D-Perturbed 1D)/Perturbed 1D

Table S25: Anharmonic potential parameters $\frac{\sqrt{h^3 c^3 \phi_j^2 \omega_j / E_h^3}}{N} \frac{\partial^3 V_{\text{harm}}}{\partial q_i^2 \partial q_j}$ (where $N = 2$ for $i \neq j$ and $N = 6$ for $i = j$) for Cp¹⁸⁷Re(CH₃)(CO)(NO). B3LYP/cc-pV5z,cc-pwCQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Values are determined by the GAUSSIAN package.

Table S25: Anharmonic potential parameters $\frac{\sqrt{I^3} e^2 \phi_j^2 \phi_k / E_h^3}{N} \frac{\partial^3 V_{\text{harm}}}{\partial q_i^2 \partial q_j}$ (where $N = 2$ for $i \neq j$ and $N = 6$ for $i = j$) for Cp¹⁸⁷Re(CH₃)(CO)(NO). B3LYP/cc-pV5z,cc-pwCVQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Values are determined by the GAUSSIAN package. (continued).

Table S25: Anharmonic potential parameters $\frac{\sqrt{h^3} e^2 \phi_j^2 \omega_j / E_h^3}{N} \frac{\partial^3 V_{\text{harm}}}{\partial q_i^2 \partial q_j}$ (where $N = 2$ for $i \neq j$ and $N = 6$ for $i = j$) for $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$. B3LYP/cc-pV5z,cc-pwCVQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Values are determined by the GAUSSIAN package. (continued).

Table S26: Anharmonic potential parameters $\frac{\sqrt{h^3} \epsilon^2 \phi_{ij} / E_h^3}{N} \frac{\partial^3 V_{\text{harm}}}{\partial q_i^2 \partial q_j}$ (where $N = 2$ for $i \neq j$ and $N = 6$ for $i = j$) for Cp¹⁸⁵Re(CH₃)(CO)(NO). B3LYP/cc-pV5Z,cc-pwCVQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Values are determined by the GAUSSIAN package.

Table S26: Anharmonic potential parameters $\frac{\sqrt{|r^3 e^{\phi_j^2} \phi_j / E_h^3}}{N} \frac{\partial^3 V_{\text{harm}}}{\partial q_i^2 \partial q_j}$ (where $N = 2$ for $i \neq j$ and $N = 6$ for $i = j$) for Cp⁸⁵Re(CH₃)(CO)(NO). B3LYP/cc-pV5z,cc-pwCvQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Values are determined by the GAUSSIAN package. (continued).

Table S26: Anharmonic potential parameters $\frac{\sqrt{h^3} \epsilon^2 \phi_{ij} / E_h^3}{\partial^2 q_i \partial q_j}$ (where $N = 2$ for $i \neq j$ and $N = 6$ for $i = j$) for Cp⁸⁵Re(CH₃)(CO)(NO). B3LYP/cc-pV5z,cc-pwCQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Values are determined by the GAUSSIAN package. (continued).

Table S26: Anharmonic potential parameters $\frac{\sqrt{|r^3 e^{\phi_i^2} \phi_j / E_h^3}}{N} \frac{\partial^3 V_{\text{harm}}}{\partial q_i^2 \partial q_j}$ (where $N = 2$ for $i \neq j$ and $N = 6$ for $i = j$) for $\text{Cp}^{85}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$. B3LYP/cc-pV5Z,cc-pwCVQZ-PP level harmonic force field was utilised for the anharmonic calculation at B3LYP level with (12s11p10d8f)[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms. Values are determined by the GAUSSIAN package. (continued).

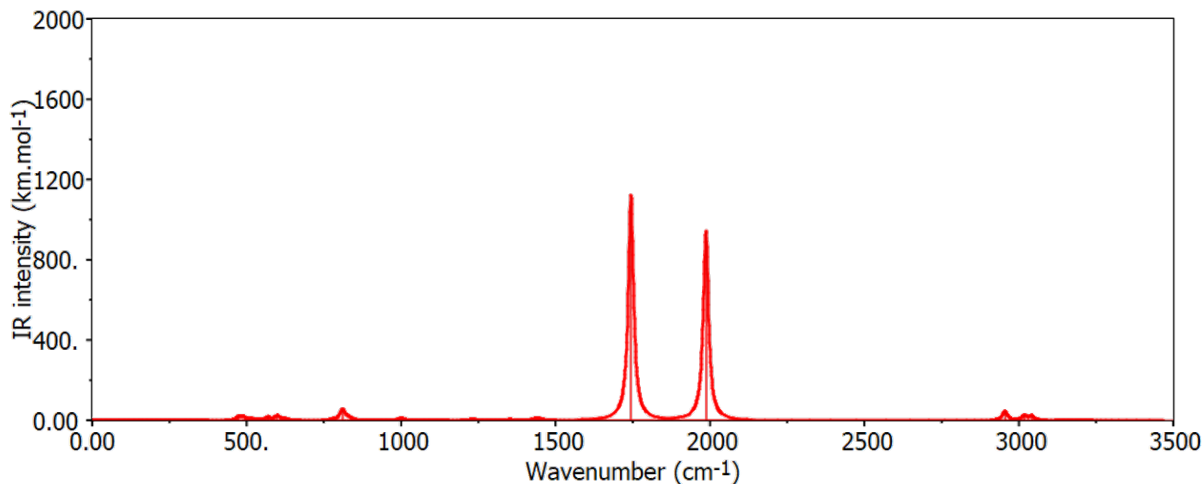

Figure S2: Harmonic vibrational spectrum of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory. Spectrum is convoluted with Lorentzian function using a full-width at half-maximum of 20 cm^{-1} . Peak positions are scaled by 0.980. The most intense peaks in the spectrum are due to the NO (left: ν_{10}) and CO (right: ν_9) stretching vibrations.

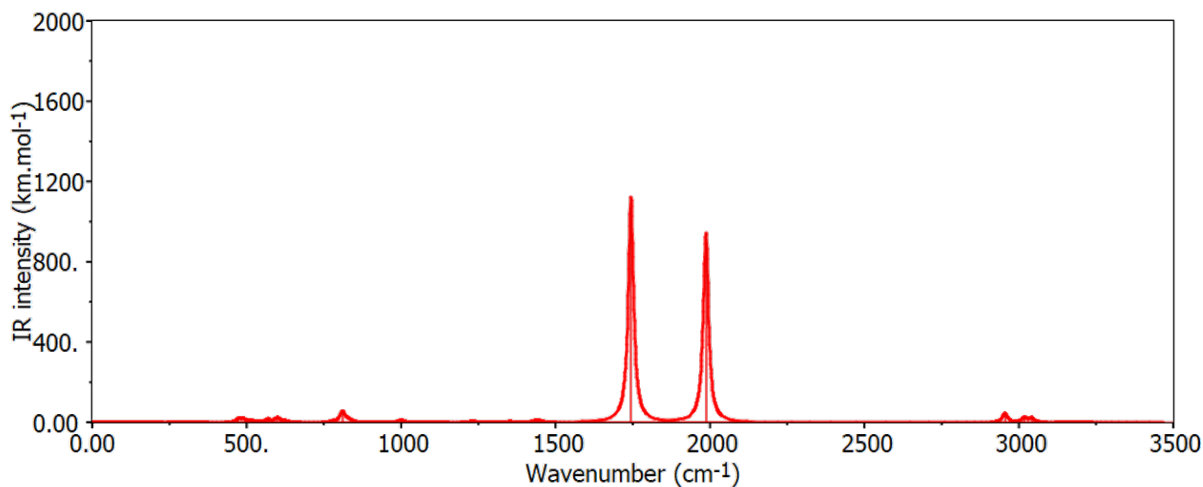

Figure S3: Harmonic vibrational spectrum of $\text{Cp}^{185}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory. Spectrum is convoluted with Lorentzian function using a full-width at half-maximum of 20 cm^{-1} . Peak positions are scaled by 0.980. The most intense peaks in the spectrum are due to the NO (left: ν_{10}) and CO (right: ν_9) stretching vibrations.

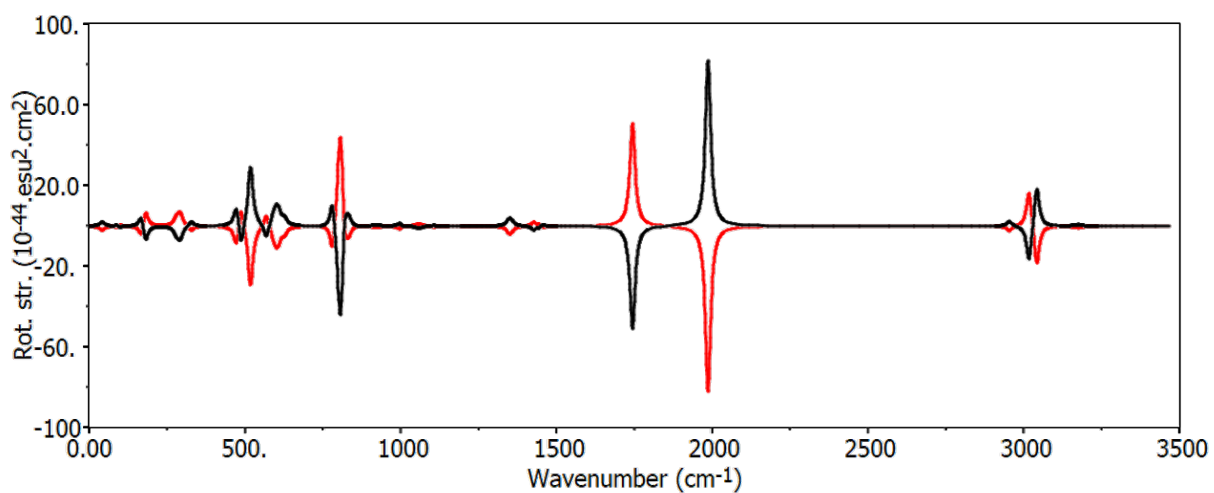

Figure S4: Harmonic vibrational circular dichroism spectrum of (R)- (red) and (S)- (black) enantiomers of $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory. Spectrum is convoluted with Lorentzian function using a full-width at half-maximum of 20 cm^{-1} . Peak positions are scaled by 0.980.

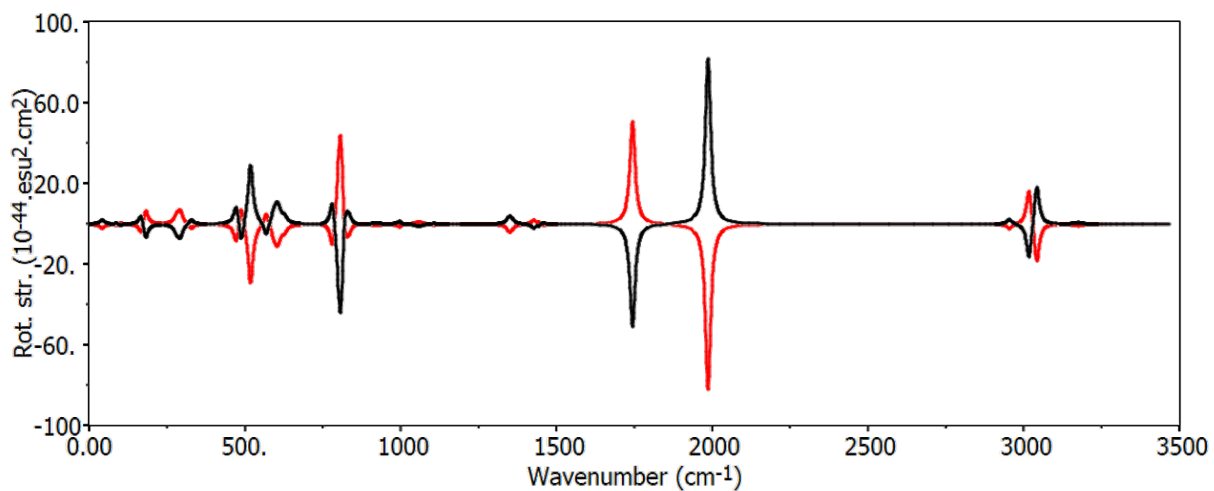

Figure S5: Harmonic vibrational circular dichroism spectrum of (R)- (red) and (S)- (black) enantiomers of $\text{Cp}^{185}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory. Spectrum is convoluted with Lorentzian function using a full-width at half-maximum of 20 cm^{-1} . Peak positions are scaled by 0.980.

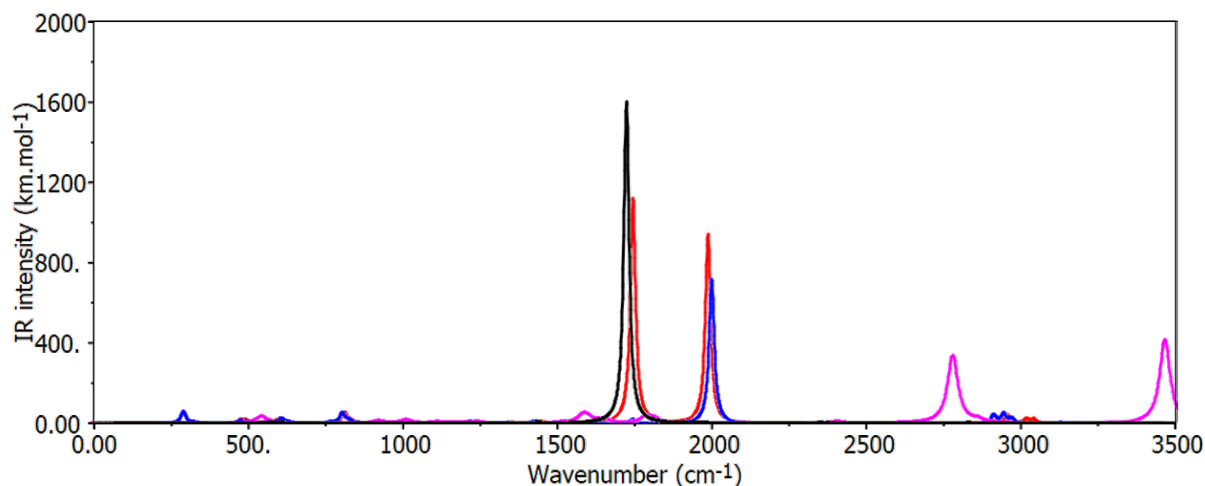

Figure S6: Scaled (0.980) harmonic (red), anharmonic fundamentals (blue), overtones (magenta) and combination (black) bands for $\text{Cp}^{187}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ structure optimized at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory. The harmonic treatment is done at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory, whereas the anharmonic calculations are performed at B3LYP level with (12s11p10d8f)/[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms employing the second order vibrational perturbation (VPT2) theory within Gaussian16 software package. Spectrum is convoluted with Lorentzian function using a full-width at half-maximum of 20 cm^{-1} . Overtone and combination bands up to 3500 cm^{-1} are included in the plot. Intensity of the overtone bands are 20 times enhanced as compared to other bands. The peak from the combination bands (black) at 1724.69 cm^{-1} is due to the combination of ν_{29} and ν_{24} bands.

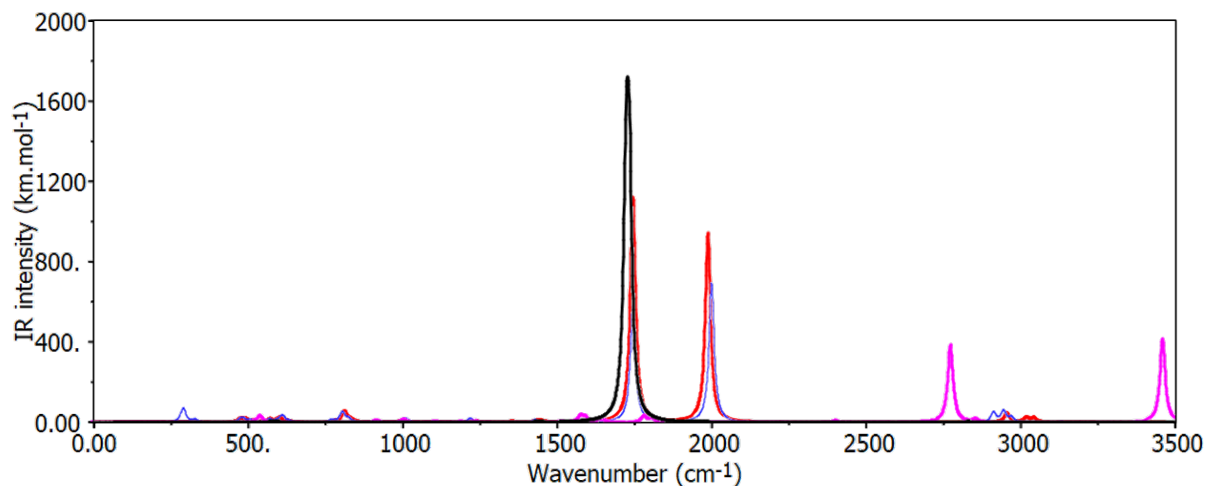

Figure S7: Scaled (0.980) harmonic (red), anharmonic fundamentals (blue), overtones (magenta) and combination (black) bands for $\text{Cp}^{185}\text{Re}(\text{CH}_3)(\text{CO})(\text{NO})$ structure optimized at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory. The harmonic treatment is done at B3LYP/cc-pV5Z,cc-pwCVQZ-PP level of theory, whereas the anharmonic calculations are performed at B3LYP level with (12s11p10d8f)/[8s7p6d4f] contraction on Re atom and cc-pVDZ basis set for H, C, N and O atoms employing the second order vibrational perturbation (VPT2) theory within Gaussian16 software package. Spectrum is convoluted with Lorentzian function using a full-width at half-maximum of 20 cm^{-1} . Overtone and combination bands up to 3500 cm^{-1} are included in the plot. Intensity of the overtone bands are 20 times enhanced, whereas the intensity of combination bands are scaled to 66% as compared to other bands. The peaks in the combination bands (black) at 1734.94 cm^{-1} and 1724.64 cm^{-1} are due to the combination of ν_{27} and ν_{25} , ν_{29} and ν_{24} bands.
