

1 **(\* Request for induction proof \*)**

2 Recall our implementation of a binary tree, which only stores data in the leaf nodes:

3 type 'a bin\_tree = Leaf of 'a | Branch of 'a bin\_tree \* 'a bin\_tree

4 Suppose we have the following type, describing colours:

5 type colour = Black | Green | Purple | Red | Blue | Orange

6 The following two functions count the number of occurrences of a colour c in a colour bin tree:

7  
8 let rec count b c = match b with  
9 | Leaf c' -> if c = c' then 1 else 0  
10 | Branch (b1, b2) -> (count b1 c) + (count b2 c)

11  
12 let rec count' b c acc = match b with  
13 | Leaf c' -> if c = c' then 1 + acc else acc  
14 | Branch (b1, b2) -> count' b1 c (count' b2 c acc)

15  
16 Prove that for any colour bin tree b, colour c, and accumulator acc,  $\text{count } b \ c + \text{acc} = \text{count}' \ b \ c \ \text{acc}$ .

17  
18 **(\* Response \*)**

19 Inductive Case:  $b = \text{Branch } (b1, b2)$

20 We assume that the theorem holds for b1 and b2. Then we have:

21  $\text{count } b \ c + \text{acc} = (\text{count } b1 \ c + \text{count } b2 \ c) + \text{acc}$  (by definition of count) =  $\text{count}' \ b1 \ c \ (\text{count}' \ b2 \ c \ \text{acc})$  (by induction  
22 hypothesis) =  $\text{count}' \ (\text{Branch } (b1, b2)) \ c \ \text{acc}$  (by definition of count')

23 Therefore, the theorem holds for any colour binary tree b, colour c, and accumulator acc.

24  
25 Step Case:  $b = \text{Branch } (b1, b2)$ .

26 Induction Hypotheses:

27 1. For any color c and accumulator acc,  $\text{count } b1 \ c + \text{acc} = \text{count}' \ b1 \ c \ \text{acc}$ .

28 2. For any color c and accumulator acc,  $\text{count } b2 \ c + \text{acc} = \text{count}' \ b2 \ c \ \text{acc}$ .

29 To Show:  $\text{count } (\text{Branch } (b1, b2)) \ c + \text{acc} = \text{count}' \ (\text{Branch } (b1, b2)) \ c \ \text{acc}$

30 We have:

31  $\text{count } (\text{Branch } (b1, b2)) \ c + \text{acc} = (\text{count } b1 \ c + \text{count } b2 \ c) + \text{acc}$  (\* by definition of count )  
32 =  $\text{count } b1 \ c + (\text{count } b2 \ c + \text{acc})$  ( by associativity of addition )  
33 =  $\text{count } b1 \ c + \text{count}' \ b2 \ c \ \text{acc}$  ( by the first induction hypothesis )  
34 =  $\text{count}' \ b1 \ c \ \text{acc} + \text{count}' \ b2 \ c \ \text{acc}$  ( by the second induction hypothesis )  
35 =  $\text{count}' \ (\text{Branch } (b1, b2)) \ c \ \text{acc}$  ( by definition of count' \*)

36  
37 Hence, we have shown that for any color binary tree b, color c, and accumulator acc,  $\text{count } b \ c + \text{acc} = \text{count}' \ b \ c \ \text{acc}$ . This  
38 completes the proof of Theorem 1.
