

```

1 User: The binomial coefficient  $B(n,k)$  is
2 the coefficient that appears on the  $x^k$ 
3 term in the expansion of the binomial power
4  $(1 + x)^n$ . It can be calculated using the
5 function:  $B(n, k) = n! / (k! (n - k)!)$ .
6
7 Implement the function binomial :
8 int -> int -> int such that binomial n k
9 computes  $B(n,k)$  using factorials.
10
11 Implement the helper function
12 factorial : int -> int yourself as an inner
13 helper function. You do not need to make the
14 implementation of factorial tail-recursive.

```
