

1 **(\* request 1 \*)**  
2 Implement the following function:  
3 `add : 'b ch -> 'b ch -> 'b ch`: to add two church numerals together.  
4  
5 Your solution must use only the inputs of `add` -- it cannot make any recursive calls, or call any other functions.  
6 Hint 1: your solution will fit on one line. Hint 2: we want to replace the "zero" of the first number with the  
7 other number.

8  
9 **(\* response 1 \*)**  
10 Here's an implementation of the `add` function in OCaml:

11  
12 `let add (n1: 'b ch) (n2: 'b ch) : 'b ch = fun z s -> n1 n2 s z` **(Wrong)**

13  
14 **(\* feedback \*)**  
15 Your solution has type  
16 `('a -> 'b) ch = ('a -> 'b) -> (('a -> 'b) -> 'a -> 'b) -> 'a -> 'b`, but an  
17 expression was expected of type `'a -> 'b`.
