

1 (\* first request \*)

2 Q8 (8 pts) For each question, write the letter (and nothing else) that refers to your answer. (ex. if your answer  
3 is "Not a real answer" you would simply put F)

- 4
- 5 A: Doubles the input
- 6 B: Adds 3 to the input
- 7 C: Adds 4 to the input
- 8 D: Adds 5 to the input
- 9 E: Adds 6 to the input
- 10 F: Not a real answer

11 Consider the following list of functions:

```
12 let lst = [(+) 1; (+) 2; (+) 3; (+) 4; (+) 5]  
13 let lst' = List.map(fun fx->(fx)+2) lst  
14 let f = List.nth lst' 1
```

15  
16  
17 Q1. What does the function f do? (choose A, B, C, D, E or F)  
18 \_\_\_\_\_

```
19  
20 let lst'' = List.filter (fun f -> f 2 > 5) lst'  
21 let f = List.nth lst'' 1
```

22 Q2. What does function f do? (choose A, B, C, D, E or F)  
23 \_\_\_\_\_

24  
25 (\* first response \*)

26 Q1. The function f takes an input, adds 2 to it, and then adds 3 to it. So the answer is **B. (Wrong)**  
27 Q2. The function f takes the second function in lst' that satisfies the condition of applying it to 2 resulting in a  
28 value greater than 5. So the answer is **D. (Correct)**

29  
30 (\* second request \*)

31 Your answer to Q2 is right, but the answer to Q1 is wrong. Note that list `lst` is a list of functions. And in OCaml  
32 the first element in a list start with index 0.

33  
34 (\* second response \*)

35 I apologize for the mistake in my previous answer.  
36 Q1. The function f takes an input, applies the second function in **lst**, adds 2 to the result, and returns it. The second  
37 function in **lst** is **(+) 2**, which adds 2 to its input. So, **f** adds 2 to its input, and then adds 2 again, resulting in adding 4 to  
38 the input. Therefore, the answer is **C. (Correct)**
