

Diagrammatic equation showing a vertex with four external lines (one straight, one wavy, one dashed, one dotted) and four internal blue circles, equal to (-1) times a vertex with the same four external lines but no internal circles.

The left side of the equation shows a central red vertex labeled e . Four lines extend from the vertex: a horizontal line to the left with a blue circle labeled \tilde{z} , a horizontal line to the right with a blue circle labeled \tilde{z} , a diagonal line up-right with a blue circle labeled \tilde{z} , and a diagonal line down-left with a blue circle labeled \tilde{z} . The right side of the equation shows a central red vertex labeled e with the same four external lines, but without the internal blue circles.

$$= (-1)$$
