

```
# Let's assume Sam's age is x
# According to the question, Ruby is 6 times older than Sam
# So, Ruby's age will be 6x
```

```
# In 9 years, Ruby will be 3 times as old as Sam
# So,  $(6x + 9) = 3(x + 9)$ 
# Solving the above equation, we get  $x = 9$ 
```

```
# Therefore, Sam's age now is 9 years old
```

```
sam_age = 9
print("Sam's age now is", sam_age, "years old.")
```
