

Task

Different doctors write **disease names** in **different ways**

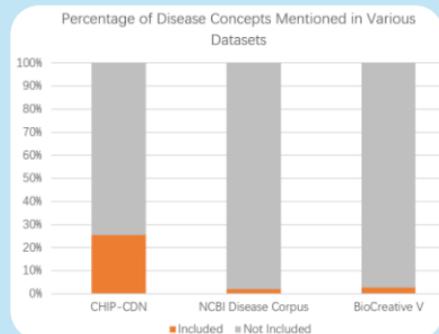

- 1) 腰4/5椎间盘突出症
(Lumbar 4/5 Disc Herniation)
- 2) 左外侧突出型L4/5膨出
(Left lateral protrusion type L4-L5 herniation)

腰椎间盘突出
(Lumbar Disc Herniation)

We want to **normalize** them into the standard name

Challenge

- **Data scarcity:** A large number of diseases are typically not covered in the dataset

Only **about 25%** of all the diseases are included in *CHIP-CDN* dataset

Methodology

We perform **data augmentation** based on the following two techniques

Axis-word Replacement:

肺炎 -> 肺部感染

(pneumonia -> lung infection)

↓ (Change an axis-word)

胃炎 -> 胃部感染

(gastritis -> stomach infection)

Multi-Granularity Aggregation:

G03.901: 颅底蛛网膜炎
(basilarachnitis)

G03.902: 脊髓蛛网膜炎
(spinal arachnoiditis)

G03.903: 硬脑膜炎
(endocranitis)

G03.9: 脑膜炎
(cephalomeningitis, meningitis)

Aggregate based on hierarchy

Result

Our approach **outperforms baseline** data augmentation methods by a large margin

DA methods (Metric)	BiLSTM (Acc)	BERT-base (Acc)
None	0.455	0.558
EDA	0.451	0.519
BT	0.466	0.556
DDA	0.485	0.578

Our approach works even better on **smaller datasets**
