

Common Web Images  
 $O(100B)$

Semantic  
Embedding

Ontology  
 $O(100)$

Keyword  
Embedding

Retrieve Top  $M$   
Nearest Neighbors  
per Keyword  
( $M \sim O(10K)$ )

```
graph LR; A[Common Web Images O(100B)] --> B[Semantic Embedding]; C[Ontology O(100)] --> D[Keyword Embedding]; B --> E[Retrieve Top M Nearest Neighbors per Keyword (M ~ O(10K))]; D --> E;
```

The diagram illustrates a two-stage retrieval process. It begins with two input sources: 'Common Web Images' (labeled  $O(100B)$ ) and an 'Ontology' (labeled  $O(100)$ ). The images are processed through a 'Semantic Embedding' step, while the ontology is processed through a 'Keyword Embedding' step. Both embedding steps then feed into a final stage: 'Retrieve Top  $M$  Nearest Neighbors per Keyword', where  $M$  is approximately  $O(10K)$ . The flow is represented by yellow and blue boxes for inputs and embeddings, and a large green arrow for the final retrieval step.
