

Figure. Two-step process of piecewise registration, shown in coronal and sagittal views. (a) Diffusion tensor images and T2-weighted images were aligned along axial direction based on the surface markers (vitamin D capsules, some of which are marked by red circles) around the wrist and elbow. (b) Both sequences were divided into several sections of around 15 slices (yellow line is the section divider, schematic only and not real). Each section had about 15 slices. The diffusion tensor images were registered to the T2-weighted images separately in each section using an affine transformation.
