

Whole problem in image format (Required)

The logistic model has been applied to the natural growth of the halibut population in certain areas of the Pacific Ocean.¹² Let y , measured in kilograms, be the total mass, or biomass, of the halibut population at time t . The parameters in the logistic equation are estimated to have the values $r = 0.71/\text{year}$ and $K = 80.5 \times 10^6 \text{ kg}$. If the initial biomass is $y_0 = 0.25K$, find the biomass 2 years later. Also find the time τ for which $y(\tau) = 0.75K$.

Answer part in image format (Required)

It is convenient to scale the solution (11) to the carrying capacity K ; thus we write Eq. (11) in the form

$$\frac{y}{K} = \frac{y_0/K}{(y_0/K) + [1 - (y_0/K)]e^{-rt}}. \tag{12}$$

Using the data given in the problem, we find that

$$\frac{y(2)}{K} = \frac{0.25}{0.25 + 0.75e^{-1.42}} \cong 0.5797.$$

Consequently, $y(2) \cong 46.7 \times 10^6 \text{ kg}$.
To find τ , we can first solve Eq. (12) for t . We obtain

$$e^{-rt} = \frac{(y_0/K)[1 - (y/K)]}{(y/K)[1 - (y_0/K)]},$$

hence

$$t = -\frac{1}{r} \ln \frac{(y_0/K)[1 - (y/K)]}{(y/K)[1 - (y_0/K)]}. \tag{13}$$

Using the given values of r and y_0/K and setting $y/K = 0.75$, we find that

$$\tau = -\frac{1}{0.71} \ln \frac{(0.25)(0.25)}{(0.75)(0.75)} = \frac{1}{0.71} \ln 9 \cong 3.095 \text{ years}.$$

review

Problem Text

or biomass, of the halibut population at time t \$. The parameters in the logistic equation are estimated to have the values $r=0.71$ /\$ year and $K=80.5 \times 10^6 \text{ kg}$ \$. If the initial biomass is $y_0=0.25 K$ \$, find the time τ \$ for which $y(\tau)=0.75K$.\$

The logistic model has been applied to the natural growth of the halibut population in certain areas of the Pacific Ocean.¹² Let y , measured in kilograms, be the total mass, or biomass, of the halibut population at time t . The parameters in the logistic equation are estimated to have the values $r = 0.71/\text{year}$ and $K = 80.5 \times 10^6 \text{ kg}$. If the initial biomass is $y_0 = 0.25K$, find the time τ for which $y(\tau) = 0.75K$.

Solution

To find τ \$, we can first solve Eq. (12) for t \$. We obtain

$$e^{-rt}=\frac{\left(y_0/K\right)\left[1-\left(y/K\right)\right]}{\left(y/K\right)\left[1-\left(y_0/K\right)\right]}$$

To find τ , we can first solve Eq. (12) for t . We obtain

$$e^{-rt} = \frac{(y_0/K) [1 - (y/K)]}{(y/K) [1 - (y_0/K)]}$$

hence

$$t = -\frac{1}{r} \ln \frac{(y_0/K) [1 - (y/K)]}{(y/K) [1 - (y_0/K)]}$$

Using the given values of r and y_0/K and setting $y/K = 0.75$, we find that

$$\tau = -\frac{1}{0.71} \ln \frac{(0.25)(0.25)}{(0.75)(0.75)} = \frac{1}{0.71} \ln 9 \cong 3.095 \text{ years}$$
