

$$R_1 \in [-1, 1]$$

Captures the alignment of the realised trajectory relative to the best trajectory.

$$R_2 \in [0, 1]$$

Captures the proximity to the best location, given the trajectory

Given a sequence of points, the TraCE between two sequential points is defined as:

$$S(x, x') = \lambda R_1 + (1 - \lambda) R_2$$

If a set of n positive points and a set of m negative points, a mean TraCE can be defined as:

$$\bar{S} = \frac{\sum_{i=1}^n S(x, x'_i) - \sum_{j=1}^m S(x, x'_j)}{n + m}$$

$\bar{S} \rightarrow 1 \implies$ strong positive alignment

$\bar{S} \rightarrow -1 \implies$ strong negative alignment
