

**Note:**

- 1). We use  to represent a DPF batch evaluation process with additional  $k_0^{dpf}$  and  $k_1^{dpf}$  from two different parties as inputs where  $(k_0^{dpf}, k_1^{dpf}) \leftarrow \text{Gen}(1^\kappa, f_{idx,1})$ .
- 2). Any two parties out of three jointly perform the DPF batch evaluation process.
- 3).  $P_i$  computes  $[[\vec{Y}]_i[idx]]_0 + [[\vec{Y}]_{i+2}[idx]]_0$  and  
 $P_{i+1}$  computes  $[[\vec{Y}]_{i+1}[idx]]_0 + [[\vec{Y}]_i[idx]]_1$  and  
 $P_{i+2}$  computes  $[[\vec{Y}]_{i+1}[idx]]_1 + [[\vec{Y}]_{i+2}[idx]]_1$  to get a (3,3)-sharing of  $\vec{Y}[idx]$ .
- 4). Three parties reshare (3,3)-sharing  $\vec{Y}[idx]$  to its RSS sharing.
