

Note:

- 1). We use to represent a DPF batch evaluation process with additional k_0^{dpf} and k_1^{dpf} from two different parties as inputs where $(k_0^{dpf}, k_1^{dpf}) \leftarrow \text{Gen}(1^\kappa, f_{idx,1})$.
- 2). Any two parties out of three jointly perform the DPF batch evaluation process.
- 3). P_i computes $\left[\left[\vec{T} \right]_i[idx] \right]_0 + \left[\left[\vec{T} \right]_{i+2}[idx] \right]_0$ and
 P_{i+1} computes $\left[\left[\vec{T} \right]_{i+1}[idx] \right]_0 + \left[\left[\vec{T} \right]_i[idx] \right]_1$ and
 P_{i+2} computes $\left[\left[\vec{T} \right]_{i+1}[idx] \right]_1 + \left[\left[\vec{T} \right]_{i+2}[idx] \right]_1$ to get a (3,3)-sharing of $\vec{T}[idx]$.
- 4). Three parties reshare (3,3)-sharing $\vec{T}[idx]$ to its RSS sharing.
