

Human-Written Text

The murine response to *Listeria monocytogenes* has long been considered a paradigm of T-cell-mediated immunity. There is, however, substantial evidence that T-cell-deficient mice are capable of surviving a *L. monocytogenes* challenge. Recently, advances have been made in our understanding of the cell biology and pathogenesis of infection.

For a long time, the murine reaction to *Listeria monocytogenes* has been regarded as a prime example of T-cell-based immunity. Nevertheless, there is now significant evidence suggesting that mice lacking T-cells can still survive when faced with a *L. monocytogenes* infection. In recent times, we have made progress in comprehending the cellular processes and disease development associated with this infection.
