Estimate Parameters of
Causal Graphical Model

requires noun
embeddings \mathbf{N}

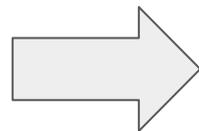

$$p_g(\cdot | \mathbf{n}_i)$$

requires adj
embeddings \mathbf{A}

$$p_a(\cdot | \mathbf{n}_i, g_i)$$

based on empirical
distribution of nouns

$$p_{\mathbf{n}_i}(\cdot)$$

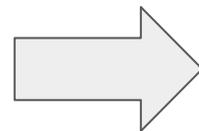

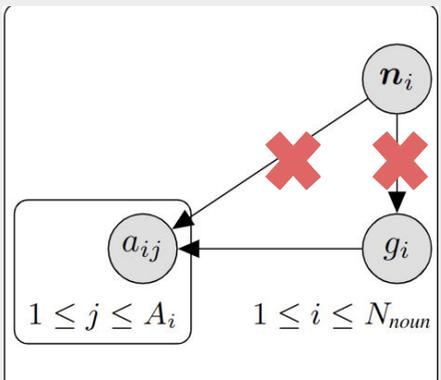

Approximate

$$p(a | \text{do}(\mathbf{G}) = g)$$

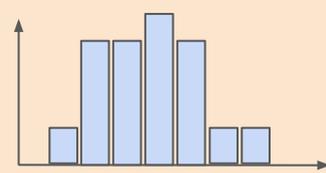

Given a set of nouns in a
corpus, \mathcal{N}_{eval} , compute:

$$p(a | \text{do}(\mathbf{G} = g)) = \sum_{\mathbf{n}_i \in \mathcal{N}_{eval}} p(a | \mathbf{G} = g, \mathbf{n}_i) p_{\mathbf{n}_i}(\mathbf{n}_i)$$

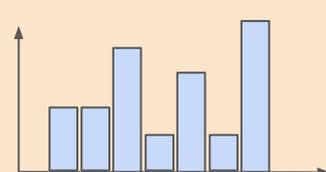

Compute Jensen
Shannon Divergence for
different g

How similar are

$$p(a | \text{do}(\mathbf{G}) = g_1)$$

and

$$p(a | \text{do}(\mathbf{G}) = g_2)$$

?
