

## 1 Finding Adversarial Examples:

From a corpus, find adversarial examples that CLIP model encodes very similarly while DINOv2 encodes differently.

Corpus:

CLIP Similarity: 0.9507

DINOv2 Similarity: 0.6297

CLIP Similarity: 0.9534

DINOv2 Similarity: 0.5776

## 2 Finding Differences in Adversarial Examples:

Given a pair of adversarial examples, manually find differences between images and formulate questions

Adversarial Examples:

Thg dog in the left image is lying on the carpet whereas the the dog in the right image is lying on the floor.

In this image, the yellow animal is lying on?  
(a) Floor (b) Carpet

## 3 Evaluating on MLLM

Evaluate whether a pair of adversarial examples and the question lead to failure on MLLMs.

MLLM Interface:

In this image, the yellow animal is lying on?  
(a) Floor (b) Carpet

(b) Carpet

Correct

In this image, the yellow animal is lying on?  
(a) Floor (b) Carpet

(b) Carpet

Incorrect

**Adversarial Examples Lead to Failures in MLLM!**
