Information from CWE website

CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')

Example Language: C

```
void f(pthread_mutex_t *mutex) {  
    pthread_mutex_lock(mutex);  
  
    /* access shared resource */  
  
    pthread_mutex_unlock(mutex);  
}
```

CWE Name

Vulnerable Example

Analysis for Vulnerability

However, the code does not check the value returned by pthread_mutex_lock() for errors. If pthread_mutex_lock() cannot acquire the mutex for any reason, the function may introduce a race condition into the program and result in undefined behavior. In order to avoid data races, correctly written programs must check the result of thread synchronization functions and appropriately handle all errors, either by attempting to recover from them or reporting them to higher levels.
